## Table of Contents

## 1. Using Amazon Web Services

## 2. Basic setup

### 2.1. Spring Cloud AWS maven dependency management

### 2.2. Amazon SDK configuration

#### 2.2.1. SDK credentials configuration

- Simple credentials configuration
- Instance profile configuration
- Mixing both security configurations
- Parameter Store Configuration credentials and region configuration

#### 2.2.2. Region configuration

- Explicit region configuration
- Automatic region configuration
- Service specific region configuration

#### 2.2.3. Spring Boot auto-configuration

- Maven dependencies
- Configuring credentials
- Configuring region

## 3. Cloud environment

### 3.1. Retrieving instance metadata

- 3.1.1. Enabling instance metadata support with XML
- 3.1.2. Enabling instance metadata support with Java
- 3.1.3. Enabling instance metadata support in Spring Boot
- 3.1.4. Using instance metadata
- 3.1.5. Using instance user data
- 3.1.6. Using instance tags
- 3.1.7. Configuring custom EC2 client
- 3.1.8. Injecting the default EC2 client

### 3.2. Integrating your Spring Cloud application with the AWS Parameter Store

## 4. Managing cloud environments

- 4.1. Automatic CloudFormation configuration
- 4.2. Manual CloudFormation configuration
- 4.3. CloudFormation configuration with Java config classes
- 4.4. CloudFormation configuration in Spring Boot
- 4.5. Manual name resolution
- 4.6. Stack Tags
- 4.7. Using custom CloudFormation client

## 5. Messaging

## **5.1. Configuring messaging**

### **5.1.1. Maven dependency configuration**

## **5.2. SQS support**

### **5.2.1. Sending a message**

Using message converters

### **5.2.2. Receiving a message**

### **5.2.3. Annotation-driven listener endpoints**

Message reply

### **5.2.4. The SimpleMessageListenerContainerFactory**

### **5.2.5. Consuming AWS Event messages with Amazon SQS**

## **5.3. SNS support**

### **5.3.1. Sending a message**

### **5.3.2. Annotation-driven HTTP notification endpoint**

## **5.4. Using CloudFormation**

# **6. Caching**

## **6.1. Configuring dependencies for Redis caches**

## **6.2. Configuring caching with XML**

### **6.2.1. Mixing caches**

### **6.2.2. Defining expiration**

## **6.3. Configuring caching using Java configuration**

### **6.3.1. Configuring expiry time for caches**

## **6.4. Configuring caching in Spring Boot**

## **6.5. Using caching**

## **6.6. Memcached client implementation**

## **6.7. Using CloudFormation**

# **7. Data Access with JDBC**

## **7.1. Configuring data source**

### **7.1.1. Maven dependency configuration**

### **7.1.2. Basic data source configuration**

### **7.1.3. Data source pool configuration**

## **7.2. Configuring data source with Java config**

### **7.2.1. Java based data source pool configuration**

## **7.3. Configuring data source in Spring Boot**

## **7.4. Read-replica configuration**

## **7.5. Failover support**

## **7.6. CloudFormation support**

## **7.7. Database tags**

# **8. Sending mails**

## **8.1. Configuring the mail sender**

## **8.2. Sending simple mails**

## **8.3. Sending attachments**

## **8.4. Configuring regions**

## **8.5. Authenticating e-mails**

# **9. Resource handling**

## **9.1. Configuring the resource loader**

## **9.2. Downloading files**

## **9.3. Uploading files**

### **9.3.1. Uploading multi-part files**

### **9.3.2. Uploading with the TransferManager**

## **9.4. Searching resources**

## **9.5. Using CloudFormation**
